BUSINESS CASE:

Controlling the compliances from our data centres been one of the challenging task. We're facing huge amount of compliances across our compliances team to solve them.

Our main motto to send to data scientist team is to reduce the compliances which are generated in our data centres. And we need to identify the compliances whether they can be prevented or detected.

After the project implementation we need to see reduced compliances and based on the data we need to identify whether the compliance can be prevented or detected.
